

STOP OVERDOSE

Overdose deaths in North Dakota increased from 20 deaths in 2013 to 68 deaths in 2017.

CDC/NCHS, National Vital Statistics System, Mortality

Naloxone competitively binds opioid receptors and is the antidote to acute opioid toxicity. With proper education, patients on long-term opioid therapy and others at risk may benefit from a naloxone prescription.

Consider prescribing intranasal spray or auto-injector naloxone to patients who are:

- Taking high doses of opioids for long-term pain management
- Receiving rotating opioid medication regimens (at risk for incomplete cross-tolerance)
- Using opioids for legitimate medical need, coupled with a suspected or confirmed history of substance use disorder or non-medical use of prescription or illicit opioids
- Using a combination of opioids plus a benzodiazepine or other sedative
- Combining opioids with alcohol, OTC, or other central nervous system depressants
- Recently released from incarceration or an abstinent based program (and presumably with a reduced opioid tolerance and high risk of relapse)
- On certain opioid preparations that may increase risk for opioid overdose such as extended release/long-acting preparations

Most private health insurance plans, Medicare, and Medicaid cover naloxone for the treatment of opioid overdose.

LEGAL AND LIABILITY CONSIDERATIONS

Prescribing naloxone is consistent with the drug's FDA-approved indication, resulting in no increased liability so long as the prescriber adheres to general rules of professional conduct.

You are protected under North Dakota law:

North Dakota offers immunity from civil and criminal liability to individuals who prescribe, distribute, dispense, receive, possess, or administer an opioid antagonist under North Dakota Century Code 23-01-42.
